Detected in omental fat and subcutaneous fat tissue (PubMed:21982743).
Function	induction:By troglitazone and pioglitazone (selective PPARG agonists), by prostaglandin J2 (PGJ2) and by L165,041 (a PPARD ligand), by vitamin D3 and, to a lesser extent, by PMA (phorbol myristate acetate) in the promyelocytic leukemia HL-60 cells. No induction by retinoic acid, nor by clofibrate (a specific PPARG agonist).,similarity:Belongs to the arrestin family.,subcellular location:Associated with plasma membrane, as well as with endosomes and lysosomes during endocytosis.,subunit:Does not bind TXN (thioredoxin).,tissue specificity:Highly expressed in skeletal muscle, placenta, kidney, adrenal gland,

Background

This gene encodes a member of the arrestin family of proteins, which regulate G protein-mediated signaling. The encoded protein is thought to act as a regulator of breast cancer growth and progression by binding to a phosphorylated form of integrin beta4, a tumor-related antigen, targeting the integrin for internalization and degradation.
