| <b>Function</b>           | function:ICAM proteins are ligands for the leukocyte adhesion protein LFA-1 (integrin alpha-L/beta-2).,similarity:Belongs to the immunoglobulin superfamily. ICAM family.,similarity:Contains 9 Ig-like C2-type (immunoglobulin-like) domains.,tissue specificity:Expressed on neurons in the most rostral segment of the mammalian brain, the telencephalon.,                                                                                                                                                                                                                                                                                                 |
| <b>Background</b>         | The protein encoded by this gene is a member of the intercellular adhesion molecule (ICAM) family. All ICAM proteins are type I transmembrane glycoproteins, contain 2-9 immunoglobulin-like C2-type domains, and bind to the leukocyte adhesion LFA-1 protein. This protein is expressed on the surface of telencephalic neurons and displays two types of adhesion activity, homophilic binding between neurons and heterophilic binding between neurons and leukocytes. It may be a critical component in neuron-microglial cell interactions in the course of normal development or as part of neurodegenerative diseases. [provided by RefSeq, Jul 2008], |
