Tissue Specificity Expressed by the liver and secreted in plasma.
function: Might be involved in complement regulation. Can associate with lipoproteins and may play a role in lipid metabolism.,PTM:N-glycosylated. Two forms are observed; one with a single side chain and the other with two.,similarity:Contains 5 Sushi (CCP/SCR) domains.,tissue specificity:Expressibly the liver and secreted in plasma.,
Background This gene encodes a secreted protein belonging to the complement factor H protein family. It binds to Pseudomonas aeruginosa elongation factor Tuf togeth with plasminogen, which is proteolytically activated. It is proposed that Tuf acts a virulence factor by acquiring host proteins to the pathogen surface, controlling
complement, and facilitating tissue invasion. Mutations in this gene are associate with an increased risk of atypical hemolytic-uremic syndrome. [provided by RefSeq, Oct 2009],
