Observed Band	38kD
Functioncatalytic activity:L-proline = D-proline.,function:Catalyzes the interconversion of L and D-proline.,miscellaneous:In contrast to the T.cruzi enzyme, lacks the conserved Cys at position 273 which is replaced by a Thr residue. The high conservation of the protein nevertheless suggests that it is nevertheless active.,similarity:Belongs to the proline racemase family.,subunit:Homodimer.,BackgroundThe protein encoded by this gene is a dehydratase that converts trans-3-hydroxy-L-proline to delta(1)-pyrroline-2-carboxylate. This enzyme may function to degrade dietary proteins that contain trans-3-hydroxy-L-proline as wel as other proteins such as collagen IV. The encoded protein can be converted to an epimerase by changing a threonine to a cysteine at a catalytic site. [provided by RefSeq, Sep 2016],matters needingAvoid repeated freezing and thawing!
