| <b>Tissue Specificity</b> | Ubiquitous. Maximal expression was seen in the heart and skeletal muscle and minimal expression seen in the kidney.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Function</b>           | function:May negatively regulate the 4-1BB-mediated signaling cascades which result in the activation of NK-kappaB and JNK1. Probable substrate recognition subunit of an ECS (Elongin BC-CUL2/5-SOCS-box protein) E3 ubiquitin-protein ligase complex which mediates the ubiquitination and subsequent proteasomal degradation of target proteins.,pathway:Protein modification; protein ubiquitination.,similarity:Contains 5 LRR (leucine-rich) repeats.,subunit:Interacts with the cytoplasmic domain of TNFRSF9. Component of the probable ECS(PPIL5) E3 ubiquitin-protein ligase complex which contains CUL2, RBX1, Elongin BC complex and PPIL5. Interacts with CUL2, RBX1, TCEB1 and TCEB2.,tissue specificity:Ubiquitous. Maximal expression was seen in the heart and skeletal muscle and minimal expression seen in the kidney., |
| <b>Background</b>         | The protein encoded by this gene contains a leucine-rich repeat (LRR). It specifically interacts with TNFRSF9/4-1BB, a member of the tumor necrosis factor receptor (TNFR) superfamily. Overexpression of this gene suppresses the activation of NF-kappa B induced by TNFRSF9 or TNF receptor-associated factor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

2 (TRAF2), which suggests that this protein is a negative regulator of TNFRSF9-mediated signaling cascades. Alternative splicing results in multiple transcript variants.[provided by RefSeq, Feb 2011],
