| <b>Cell Pathway</b>       | Cytoplasm . Cytoplasmic vesicle, secretory vesicle membrane . Recruited to the vesicle membrane in a GTP- and RAB3B-dependent manner in epithelial cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Tissue Specificity</b> | Moderate to high levels of expression in thyroid, ovary, stomach, heart, pancreas, skeletal muscle, kidney and liver. Also detected in epithelial cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Function</b>           | domain: The N-terminus of the RabBD domain is necessary and sufficient for interaction with RAB27A., function: Rab GTPase effector involved in the late steps of regulated exocytosis, both in endocrine and exocrine cells (By similarity). Acts as a potential RAB3B effector protein in epithelial cells., similarity: Contains 1 FYVE-type zinc finger., similarity: Contains 1 RabBD (Rab-binding) domain., subcellular location: Recruited to the vesicle membrane in a GTP- and RAB3B-dependent manner in epithelial cells., subunit: Recruited to dense-core vesicles through specific interaction with RAB27A in endocrine cells. Interacts with RAB3A, RAB3B, RAB3C and RAB3D. Interacts with ZYX., tissue specificity: Moderate to high levels of expression in thyroid, ovary, stomach, heart, pancreas, skeletal muscle, kidney and liver. Also detected in epithelial cells., |
| <b>Background</b>         | The protein encoded by this gene plays a direct regulatory role in calcium-ion-dependent exocytosis in both endocrine and exocrine cells and plays a key role in insulin secretion by pancreatic cells. This gene is likely a tumor suppressor. Alternative splicing results in multiple transcript variants encoding                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

distinct isoforms. [provided by RefSeq, Jun 2010],

**matters needing attention**

Avoid repeated freezing and thawing!

**Usage suggestions**

This product can be used in immunological reaction related experiments. For more information, please consult technical personnel.
