Function	catalytic activity: L-serine = pyruvate + NH ₃ ; cofactor: Pyridoxal phosphate; pathway: Carbohydrate biosynthesis; gluconeogenesis; similarity: Belongs to the serine/threonine dehydratase family; subunit: Homodimer.
Background	This gene encodes one of three enzymes that are involved in metabolizing serine and glycine. L-serine dehydratase converts L-serine to pyruvate and ammonia and requires pyridoxal phosphate as a cofactor. The encoded protein can also metabolize threonine to NH ₄ ⁺ and 2-ketobutyrate. The encoded protein is found predominantly in the liver. [provided by RefSeq, Jul 2008]
