function: Essential for the control of the cell cycle at the G1/S (start) transition Potentiates the transcriptional activity of ATF5., similarity: Belongs to the cyclin family. Cyclin D subfamily., subunit: Intwith the CDK4 and CDK6 protein kinases to form a serine/threonine kinase holoenzyme complex. The cyclin subunit imparts substrate specificity to the complex. Interacts with ATF5. Interacts with EIF3K.,	lin teracts
Background  The protein encoded by this gene belongs to the highly conserved cyclin fa whose members are characterized by a dramatic periodicity in protein abunt through the cell cycle. Cyclins function as regulators of CDK kinases. Differ cyclins exhibit distinct expression and degradation patterns which contribute temporal coordination of each mitotic event. This cyclin forms a complex wifunctions as a regulatory subunit of CDK4 or CDK6, whose activity is required cell cycle G1/S transition. This protein has been shown to interact with and involved in the phosphorylation of tumor suppressor protein Rb. The CDK4 or	dance

Western Blot analysis of COS7 cells using Cyclin D3 Polyclonal Antibody

Immunohistochemical analysis of paraffin-embedded Human tonsil. Antibody was diluted at 1:100(4° overnight). High-pressure and temperature Tris-EDTA,pH8.0 was used for antigen retrieval. Negetive contrl (right) obtaned from antibody was pre-absorbed by immunogen peptide.

Immunohistochemistry analysis of paraffin-embedded human lung carcinoma tissue, using Cyclin D3 Antibody. The picture on the right is blocked with the synthesized peptide.

Western blot analysis of lysates from COS7 cells, treated with Forskolin 40nM 30', using Cyclin D3 Antibody. The lane on the right is blocked with the synthesized peptide.
