sumoylation of a number of proteins such as HIF1A

Background	The modification of proteins with ubiquitin is an important cellular mechanism for targeting abnormal or short-lived proteins for degradation. Ubiquitination involves
	at least three classes of enzymes: ubiquitin-activating enzymes, or E1s,
	ubiquitin-conjugating enzymes, or E2s, and ubiquitin-protein ligases, or E3s. This
	gene encodes a member of the E2 ubiquitin-conjugating enzyme family. Four
	alternatively spliced transcript variants encoding the same protein have been
	found for this gene. [provided by RefSeg. Jul 2008].
