PHKB Polyclonal Antibody

Catalog No	YP-Ab-14910
lsotype	IgG
Reactivity	Human;Mouse
Applications	WB;IHC
Gene Name	РНКВ
Protein Name	Phosphorylase b kinase regulatory subunit beta
Immunogen	The antiserum was produced against synthesized peptide derived from human KPBB. AA range:661-710
Specificity	PHKB Polyclonal Antibody detects endogenous levels of PHKB protein.
Formulation	Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.
Source	Polyclonal, Rabbit,IgG
Purification	The antibody was affinity-purified from rabbit antiserum by affinity-chromatography using epitope-specific immunogen.
Dilution	WB 1:500-2000;IHC-p 1:50-300
Concentration	1 mg/ml
Purity	≥90%
Storage Stability	-20°C/1 year
Synonyms	PHKB; Phosphorylase b kinase regulatory subunit beta; Phosphorylase kinase subunit beta
Observed Band	124kD
Cell Pathway	Cell membrane ; Lipid-anchor ; Cytoplasmic side .
Tissue Specificity	Uterus,
Function	disease:Defects in PHKB are the cause of glycogen storage disease type 9B (GSD9B) [MIM:261750]; also known as phosphorylase kinase deficiency of liver and muscle (PKD). GSD9B is a metabolic disorder characterized by hepathomegaly, only slightly elevated transaminases and plasma lipids, clinical improvement with increasing age, and remarkably no clinical muscle involvement. Biochemical observations suggest that this mild phenotype is caused by an incomplete holoenzyme that lacks the beta subunit, but that may possess residual activity.,enzyme regulation:By phosphorylation of various serine residues.,function:Phosphorylase b kinase catalyzes the phosphorylation of serine in certain substrates, including troponin I. The beta chain acts as a regulatory unit and modulates the activity of the holoenzyme in response to

BackgroundPhosphorylase kinase is a polymer of 16 subunits, four each of alpha, beta,
gamma and delta. The alpha subunit includes the skeletal muscle and hepatic
isoforms, encoded by two different genes. The beta subunit is the same in both
the muscle and hepatic isoforms, encoded by this gene, which is a member of the
phosphorylase b kinase regulatory subunit family. The gamma subunit also
includes the skeletal muscle and hepatic isoforms, encoded by two different
genes. The delta subunit is a calmodulin and can be encoded by three different
genes. The delta subunits contain the active site of the enzyme, whereas the
alpha and beta subunits have regulatory functions controlled by phosphorylation.
The delta subunit mediates the dependence of the enzyme on calcium
concentration. Mutations in this gene cause glycogen storage disease type 9B,
also known as phosphorylase kinase deficiencyMatters needing
attentionAvoid repeated freezing and thawing!Usage suggestionsThis product can be used in immunological reaction related experiments. For
