Function function:Odorant receptor .,similarity:Belongs to the G-protein coupled rec	eptor 1
Background Olfactory receptors interact with odorant molecules in the nose, to initiate neuronal response that triggers the perception of a smell. The olfactory reproteins are members of a large family of G-protein-coupled receptors (G arising from single coding-exon genes. Olfactory receptors share a 7-transmembrane domain structure with many neurotransmitter and horm receptors and are responsible for the recognition and G protein-mediated transduction of odorant signals. The olfactory receptor gene family is the I the genome. The nomenclature assigned to the olfactory receptor genes proteins for this organism is independent of other organisms.
