Tissue Specificity	Bone marrow,Thymus,
Function	function:DNA primase is the polymerase that synthesizes small RNA primers for the Okazaki fragments made during discontinuous DNA replication.,miscellaneous:The bound zinc ion is not a cofactor. It is bound to a zinc knuckle motif that may be involved in sequence recognition and the binding of ssDNA.,similarity:Belongs to the eukaryotic-type primase small subunit family.,subunit:Heterodimer of a small subunit and a large subunit.,
Background	The replication of DNA in eukaryotic cells is carried out by a complex chromosomal replication apparatus, in which DNA polymerase alpha and primase are two key enzymatic components. Primase, which is a heterodimer of a small subunit and a large subunit, synthesizes small RNA primers for the Okazaki
