<b>Cell Pathway</b>	Cell surface . Cell junction, focal adhesion . Cytoplasm, cytoskeleton . Localized at cell periphery preferentially to fibrillar adhesions than focal adhesions. Translocates from the cell edge to cell center in an ITGB1BP1-dependent manner.
<b>Tissue Specificity</b>	Ubiquitous.
<b>Function</b>	function:May be involved in cell migration, cartilage development and in linking signal transduction pathways to the cytoskeleton.;PTM:Rapidly cleaved by calpain II.;PTM:Tyrosine phosphorylated.;similarity:Contains 1 C2 tensin-type domain.;similarity:Contains 1 phosphatase tensin-type domain.;similarity:Contains 1 SH2 domain.;subunit:Binds to actin filaments and interacts with phosphotyrosine-containing proteins. Interacts with STARD8.;tissue specificity:Ubiquitous.;
<b>Background</b>	The protein encoded by this gene localizes to focal adhesions, regions of the plasma membrane where the cell attaches to the extracellular matrix. This protein crosslinks actin filaments and contains a Src homology 2 (SH2) domain, which is often found in molecules involved in signal transduction. This protein is a substrate of calpain II. Alternative splicing results in multiple transcript variants

encoding different isoforms. [provided by RefSeq, Apr 2015],
