Function	catalytic activity:10-formyltetrahydrofolate + NADP(+) + H(2)O = tetrahydrofolate + CO(2) + NADPH.,similarity:Belongs to the aldehyde dehydrogenase family.,similarity:Contains 1 acyl carrier domain.,similarity:In the C-terminal section; belongs to the aldehyde dehydrogenase family. ALDH1L subfamily.,similarity:In the N-terminal section; belongs to the GART family.,
Background	The protein encoded by this gene catalyzes the conversion of 10-formyltetrahydrofolate, nicotinamide adenine dinucleotide phosphate (NADP+), and water to tetrahydrofolate, NADPH, and carbon dioxide. The encoded protein belongs to the aldehyde dehydrogenase family. Loss of function or expression of this gene is associated with decreased apoptosis, increased cell motility, and cancer progression. There is an antisense transcript that overlaps on the opposite strand with this gene locus. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Jun 2012],
