Function	Catalytic subunit of N-terminal acetyltransferase complexes which display alpha (N-terminal) acetyltransferase activity . Acetylates amino termini that are devoid of initiator methionine . The alpha (N-terminal) acetyltransferase activity may be important for vascular , hematopoietic and neuronal growth and development. Without NAA15 , displays epsilon (internal) acetyltransferase activity towards HIF1A , thereby promoting its degradation . Represses MYLK kinase activity by acetylation , and thus represses tumor cell migration . Acetylates , and stabilizes TSC2 , thereby repressing mTOR activity and suppressing cancer development . Acetylates HSPA1A and HSPA1B at 'Lys-77' which enhances its chaperone activity and leads to preferential binding to co-chaperone HOPX . Acetylates HIST1H4A . Acts as a negative regulator of sister chromatid cohesion during mitosis .
