| <b>Cell Pathway</b>                | Nucleus . May also localize to the cytoplasm and the cell membrane. .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Tissue Specificity</b>          | Highest expression in thymus , pancreas and testis. Also detected in heart , placenta , lung , liver , skeletal muscle , kidney , spleen , prostate , ovary , small intestine and colon. Poorly detected in brain and leukocytes. Strong protein expression in lymph node (cortical , paracortical and medullar regions) , thyroid (follicular epithelial cells) , testis (developing spermatozoa) , stomach (cells lining the gastric pit) , pancreas , kidney (proximal and distal-tubule cells and collecting duct cells but not in glomeruli) , endometrium and colon (goblet cells) . Moderate protein expression in spleen , prostate (epithelium and squamous cell carcinomas) , placenta and adrenal gland. Weak protein expression in liver , heart , breast , ovary , and lung. No protein expression in brain and bladder. High protein expression in most lymphomas and melanomas. |
| <b>Function</b>                    | Has a ubiquitin-protein ligase activity acting as an E3 ubiquitin protein ligase or as an ubiquitin-ubiquitin ligase promoting elongation of ubiquitin chains on substrates. By mediating 'Lys-48'-linked polyubiquitination of proteins could target them for proteasomal degradation . May also function as a chaperone , playing a role in transport to the cell membrane of BSG/Basigin for instance . Probable                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

inactive PPIase with no peptidyl-prolyl cis-trans isomerase activity .

## Background

### matters needing attention

Avoid repeated freezing and thawing!

### Usage suggestions

This product can be used in immunological reaction related experiments. For more information, please consult technical personnel.
