Tissue Specificity	[Isoform 1]: Predominantly expressed in normal cervix (at protein level). ; [Isoform 4]: Expressed in some neoplastic cervical tissues, but not in normal cervix (at protein level). ; [Isoform 5]: Expressed in a few neoplastic cervical tissues. ; [Isoform 6]: Expressed in a few neoplastic cervical tissues. ; [Isoform 8] : High expression in liver.
Function	catalytic activity:R-CHOH-R' + NADP(+) = R-CO-R' + NADPH.,function:Reduces all-trans-retinal and 9-cis retinal. Can also catalyze the oxidation of all-trans-retinol with NADP as co-factor, but with much lower efficiency. Reduces alkyl phenyl ketones and alpha-dicarbonyl compounds with aromatic rings, such as pyrimidine-4-aldehyde, 3-benzoylpyridine, 4-benzoylpyridine, menadione and 4-

hexanoylpyridine. Has no activity towards aliphatic aldehydes and ketones.,
miscellaneous:Inhibited by kaempferol, quercetin, genistein and myristic acid.,
similarity:Belongs to the short-chain dehydrogenases/reductases (SDR) family.,
subcellular location:Isoform 1 is peroxisomal, while isoform 4 is not.,
subunit:Homotetramer.,tissue specificity:Isoform 1 is predominantly expressed in
normal cervix (at protein level). Isoform 4 is expressed in some neoplastic
cervical tissues, but not in normal cervix (at protei
