

ATP5H Monoclonal Antibody

Catalog No	YP-mAb-16390
Isotype	IgG
Reactivity	Human;Mouse;Rat
Applications	WB
Gene Name	ATP5H
Immunogen	The antiserum was produced against synthesized peptide derived from human ATP5H. AA range:111-160
Specificity	ATP5H Monoclonal Antibody detects endogenous levels of ATP5H protein.
Formulation	Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.
Source	Monoclonal, Mouse,IgG
Purification	The antibody was affinity-purified from mouse antiserum by affinity-chromatography using epitope-specific immunogen.
Dilution	WB 1:500-1:2000
Concentration	1 mg/ml
Purity	≥90%
Storage Stability	-20°C/1 year
Synonyms	My032;ATPQ;ATP5PD;ATP5JD;ATP5;ATP5H;ATP synthase subunit d mitochondrial;ATP synthase subunit d;mitochondrial;ATPase subunit d
Observed Band	26kD
Calculated Molecular Weight	26kD
Cell Pathway	Mitochondrion. Mitochondrion inner membrane.
Tissue Specificity	Bone marrow,Brain,Fetal brain,Fetal
Function	function:Mitochondrial membrane ATP synthase (F(1)F(0) ATP synthase or Complex V) produces ATP from ADP in the presence of a proton gradient across the membrane which is generated by electron transport complexes of the respiratory chain. F-type ATPases consist of two structural domains, F(1) - containing the extramembraneous catalytic core, and F(0) - containing the membrane proton channel, linked together by a central stalk and a peripheral stalk. During catalysis, ATP synthesis in the catalytic domain of F(1) is coupled via a rotary mechanism of the central stalk subunits to proton translocation. Part of the complex F(0) domain and the peripheric stalk, which acts as a stator to hold the catalytic alpha(3)beta(3) subcomplex and subunit a/ATP6 static relative to the rotary elements.,similarity:Belongs to the ATPase d subunit family.,

subunit:F-type ATPases have 2 components, CF(1) - the

Background

Mitochondrial ATP synthase catalyzes ATP synthesis, utilizing an electrochemical gradient of protons across the inner membrane during oxidative phosphorylation. It is composed of two linked multi-subunit complexes: the soluble catalytic core, F1, and the membrane-spanning component, Fo, which comprises the proton channel. The F1 complex consists of 5 different subunits (alpha, beta, gamma, delta, and epsilon) assembled in a ratio of 3 alpha, 3 beta, and a single representative of the other 3. The Fo seems to have nine subunits (a, b, c, d, e, f, g, F6 and 8). This gene encodes the d subunit of the Fo complex. Alternatively spliced transcript variants encoding different isoforms have been identified for this gene. In addition, three pseudogenes are located on chromosomes 9, 12 and 15.
