

ATP5I Monoclonal Antibody

Catalog No	YP-mAb-16391
Isotype	IgG
Reactivity	Human;Mouse;Rat
Applications	WB
Gene Name	ATP5I
Immunogen	The antiserum was produced against synthesized peptide derived from human ATP5I. AA range:20-69
Specificity	ATP5I Monoclonal Antibody detects endogenous levels of ATP5I protein.
Formulation	Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.
Source	Monoclonal, Mouse,IgG
Purification	The antibody was affinity-purified from mouse antiserum by affinity-chromatography using epitope-specific immunogen.
Dilution	WB 1:500-1:2000
Concentration	1 mg/ml
Purity	≥90%
Storage Stability	-20°C/1 year
Synonyms	ATPase subunit e;ATP5ME;ATP5K;ATP synthase subunit e;mitochondrial;N-terminally processed;ATP synthase membrane subunit e;ATP5I;ATP synthase subunit e mitochondrial
Observed Band	8kD
Calculated Molecular Weight	8kD
Cell Pathway	Mitochondrion. Mitochondrion inner membrane.
Tissue Specificity	Fetal brain,Kidney,
Function	function:Mitochondrial membrane ATP synthase (F(1)F(0) ATP synthase or Complex V) produces ATP from ADP in the presence of a proton gradient across the membrane which is generated by electron transport complexes of the respiratory chain. F-type ATPases consist of two structural domains, F(1) - containing the extramembraneous catalytic core, and F(0) - containing the membrane proton channel, linked together by a central stalk and a peripheral stalk. During catalysis, ATP synthesis in the catalytic domain of F(1) is coupled via a rotary mechanism of the central stalk subunits to proton translocation. Part of the complex F(0) domain. Minor subunit located with subunit a in the membrane.,similarity:Belongs to the ATPase e subunit family.,subunit:F-type

ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(0) seems to have nine subunits: a, b, c,

Background

Mitochondrial ATP synthase catalyzes ATP synthesis, utilizing an electrochemical gradient of protons across the inner membrane during oxidative phosphorylation. It is composed of two linked multi-subunit complexes: the soluble catalytic core, F1, and the membrane-spanning component, Fo, which comprises the proton channel. The F1 complex consists of 5 different subunits (alpha, beta, gamma, delta, and epsilon) assembled in a ratio of 3 alpha, 3 beta, and a single representative of the other 3. The Fo seems to have nine subunits (a, b, c, d, e, f, g, F6 and 8). This gene encodes the e subunit of the Fo complex. Alternative splicing results in multiple transcript variants.[provided by RefSeq, Jun 2010],
